

Project Title: AI-Powered Digital Safety Co-pilot

Problem Statement:

Digital scams, phishing, fake job offers, investment fraud, impersonation and fraudulent payment requests are increasingly common across SMS, WhatsApp, email, websites and social media. Build an AI-powered Digital Safety Copilot that allows users to check suspicious messages, screenshots, URLs, QR codes or documents before they click, pay, download or share information. The system should analyse the submitted content, identify warning signs, provide an understandable risk assessment and recommend appropriate action. The objective is to make digital safety understandable and accessible to ordinary users.

Scope of the Problem We Are Solving

- Our solution focuses on protecting common citizens in India from **digital and financial frauds** by using AI to identify suspicious messages, calls, links, websites, payment requests, and scam patterns.
- The system will help users understand potential risks and provide **real-time warnings, explanations, and recommended safety actions** before they lose money or sensitive information.
- The solution will primarily address scams such as **UPI/payment fraud, phishing, fake customer-care scams, investment/job scams, OTP-related fraud, impersonation scams, and malicious links**. It is designed especially for citizens who may have limited awareness of evolving digital fraud techniques.
- **In simple words:**
Input → AI analyses the situation → Detects potential fraud → Explains the risk → Warns the user → Suggests what to do next.

Our Proposed Solution

- We propose an **AI-Powered Digital Safety Copilot**—an intelligent, user-friendly platform that acts as a digital safety assistant for everyday users.

Users can simply **paste or upload suspicious content**, such as:

- SMS or WhatsApp messages
- Emails and screenshots
- URLs and website links
- QR codes
- Documents or images
- Job offers or investment-related communications

The system analyze the submitted content using **Artificial Intelligence, OCR, URL analysis, pattern recognition, and trusted-source verification** to identify possible indicators of fraud or digital threats.

How the Solution Works

The platform will analyze the submitted content and provide:

Risk Score → Detected Warning Signs → Explanation → Recommended Action

For example, if a user receives a message claiming to be from a bank and asking them to click a link and enter their credentials, the system can identify suspicious patterns, analyze the URL, compare relevant information with trusted sources, assign an appropriate risk level, explain the reasons behind the warning, and advise the user **not to click the link or share sensitive information**.

The goal is not merely to say **“This is a scam.”** Instead, the system will explain the evidence and reasoning in **simple, understandable language**, helping users understand *why* the content appears suspicious.

Key Features

- AI-powered scam/fraud detection
- Suspicious message & URL analysis
- Payment/UPI risk assessment
- Risk score: Low / Medium / High / Critical
- Simple explanation of *why* something is suspicious
- Recommended safety actions
- Support for Indian languages
- Optional family/caregiver assistance

Targeted Users

Primary Target Users:

- Senior Citizens (50+ years) — especially those who use UPI, online banking, smartphones, WhatsApp, and other digital services.
- Digitally active but less tech-confident users who may find it difficult to identify sophisticated scams.
- Users of digital financial services such as UPI, mobile banking, ATMs, and online payments.

Secondary Target Users:

- Family members/caregivers who want to help protect elderly parents or relatives.
- General citizens who want an AI assistant to verify suspicious messages, links, calls, or payment requests.

Key Innovation

- The key idea is to make digital safety **accessible to non-technical users**.
- Instead of requiring users to understand cybersecurity terminology or manually investigate suspicious content, the Copilot provides an easy “**Check Before You Act**” experience.
- Where feasible, the platform will also support **regional languages**, making digital safety guidance more accessible to a wider section of society.

Expected Impact

The proposed solution aims to help users:

- Detect potential scams before becoming victims
- Avoid malicious links and fraudulent payment requests
- Identify phishing and impersonation attempts
- Recognize fake job and investment offers
- Understand the warning signs behind suspicious communications
- Make safer digital decisions with greater confidence

Hackathon Objective

- Through this hackathon, we aim to develop a **working prototype/MVP** demonstrating the core capabilities of the Digital Safety Copilot—from user submission and AI-based analysis to risk scoring, evidence-backed explanation, and actionable safety recommendations.
- **Our vision is simple: Before you Click, Pay, Share, or Trust — Check with your Digital Safety Copilot.**
